The chromosomal components were isolated but the material which is responsible for inheritance remained unanswered. Griffith's experiment was a stepping stone for the discovery of genetic material. It took a long time for the acceptance of DNA as genetic material. Let's go through the discovery of DNA as genetic material.

Although DNA is the genetic material in most organisms, in some viruses, RNA is the genetic material. In fact, according to studies, RNA was the first genetic material. But, since RNA is unstable, DNA evolved from RNA with chemical modifications, making it more stable and more fit to carry genetic information.

Hershey and Chase confirm that DNA is the genetic material. Conclusive evidence for DNA as the genetic material came in 1952 from two American biologists, Alfred Hershey and Martha Chase. Hershey and Chase were studying viruses that infect bacteria. This type of virus, called a bacteriophage (bak-TEER-ee-uh-FAYJ), or "phage" for short ...
