### Endocrine system questions 1 (practice) | Khan Academy

The endocrine system is a chemical messenger system comprising feedback loops of the hormones released by internal glands of an organism directly into the circulatory system, regulating distant target organs. In humans, the major endocrine glands are the thyroid gland and the adrenal glands. In vertebrates, the hypothalamus is the neural control center for all endocrine systems.

### Endocrine system - Wikipedia

For example regulation of blood lipids and cholesterol are classified as Metabolic and Endocrine. Studies on nutrition, diet and obesity and/or physical activity and exercise are context based and should only be coded as Metabolic if they relate to metabolism. e.g. diet and exercise interventions specifically aimed at reducing cholesterol levels.

### Metabolic and endocrine - HRCS Online

The endocrine system coordinates functioning between different organs through hormones, which are chemicals released into the bloodstream from specific types of cells within endocrine (ductless) glands. Once in circulation, hormones affect function of the target tissues, which may be another endocrine gland or an end organ.

### Overview of the Endocrine System - Endocrine and Metabolic ...

Through these actions, the endocrine system regulates nearly every metabolic activity of the body to produce an integrated response. The endocrine system can release hormones to induce the stress response, regulate the heartbeat or blood pressure, and generally directs how your cells grow and develop.
